Figure 1 Sensitivity Temperature Dependence

Figure 1 shows the variation in sensitivity caused by changes in temperature.  
This data is taken from a typical batch of sensors.

Figure 2 Zero Temperature Dependence

Figure 2 shows the variation in zero output caused by changes in temperature, expressed as ppm gas equivalent, referenced to zero at 20°C.  
This data is taken from a typical batch of sensors.

Figure 3 Effect of Load Resistor Value on Noise

Figure 3 shows the effect of the load resistor on the RMS zero noise for the NO2-B1 sensor. The mean and ±95% confidence intervals are shown.  
The t90 response time increases linearly with increasing load resistor value. If a fast response is required then a 10 Ω load resistor should be employed; this will give a fast response.

Note: Above 85% rh and 40°C a maximum continuous exposure period of 10 days is warranted. Where such exposure occurs the sensor will recover normal electrolyte volumes when allowed to rest at lower % rh and temperature levels for several days.
