

APOGEE NDVI & PRI SENSORS | S2-100 Series & S2-400 Series

Two-band radiometers inform environment and plant health

Features

Overview

Apogee two-band radiometers combine two photodetectors that measure specific wavelength ranges. They are designed to continuously measure reflectance for calculation of the normalized difference vegetation index (NDVI) or photochemical reflectance index (PRI) of plant canopies.

Key Features

Digital SDI-12 output is standard with analog options available by request. Domed diffuser promotes self-cleaning to minimize errors from dust and debris.

Wavelength Ranges

NDVI (S2-411, S2-412)

- Red detector = 650 nm with 10 nm FWHM*
- NIR detector = 810 nm with 10 nm FWHM

PRI (S2-421, S2-422)

- Green detector = 532 nm with 10 nm FWHM
- Yellow detector = 570 nm with 10 nm FWHM

*FWHM = full-width half-max

$$NDVI = \frac{\rho_{NIR} - \rho_{Red}}{\rho_{NIR} + \rho_{Red}} \quad PRI = \frac{\rho_{Green} - \rho_{Yellow}}{\rho_{Green} + \rho_{Yellow}}$$

Where ρ = reflectance (%)

For Best Measurements

For best results, we recommend pairing upward-looking sensor(s) with downward-looking sensors.

NDVI Spectral Response

Above: The NDVI sensors have the spectral ranges of 650 nm with 10 nm full-width half-maximum (Red) and 810 nm with 10 nm full-width half-maximum (NIR). The spectral responses can be seen in the graph to the left.

PRI Spectral Response

Above: The PRI sensors have the spectral ranges of 532 nm with 10 nm full-width half-maximum (Green) and 570 nm with 10 nm full-width half-maximum (Yellow). The spectral responses can be seen in the graph to the left.

APOGEE NDVI SERIES | S2-111, S2-112, S2-411, and S2-412

Overview

NDVI provides a measure of canopy chlorophyll content and leaf area and is often used to monitor green-up in the spring and senescence in the fall.

APOGEE PRI SERIES | S2-121, S2-122, S2-421, and S2-422

Overview

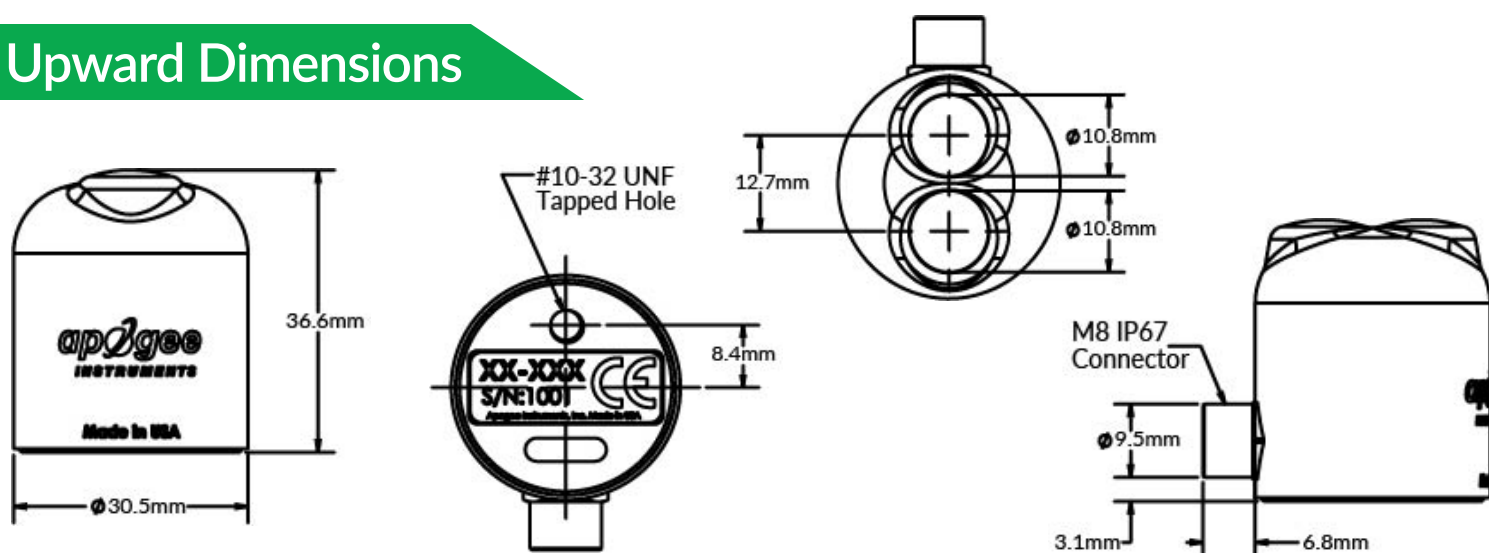

PRI is related to canopy light use efficiency and is often used in studies of canopy light use efficiency and response to stress.
